

easyCBM

DETAILED PERCENTILE LOOKUP TABLE

updated: August 6, 2014

This document contains detailed percentile lookup tables that show the exact percentile for every possible score on all easyCBM measures. The percentiles represent the proportion of students who performed below each given score. So for a student who scored in the 30th percentile, the teacher might tell the parent that his or her student scored above 30 percent of the other students.

The percentiles and scores for the English language reading and mathematics tests in this document were calculated using a nationally-representative stratified norm sample, with 500 students drawn from each of four regions (West, Midwest, Northeast, Southeast), for a total sample of 2000 students per measure. These norms were developed in 2013 - 2014 and will be updated in 2020 (and on a five year rotation thereafter). More detailed information about the norming process, including specific scores for the various demographic groups included in the sample, can be found in Saven et al. (2014) (available on brtprojects.org.)

The percentiles for the Spanish language reading tests were calculated from a much smaller sample of students, K - 2, who took the Spanish-language reading tests in School Year 2012 - 2013. The Spanish norms should be used with caution, as the norm group had only a few hundred students, rather than several thousand.

The two sets of norms (district use and teacher use) may differ slightly as they have been based on different random samples of students from each region. This slight variation provides greater generalization to the outcomes and should remind teachers and administrators that all measurement contains some minor amount of error and score values are best represented in confidence bands (the range of scores within which we can be confident a specific score is present). Note also that the IPRs are sampled proportionately by region not by race-ethnicity- gender.
